

AtliQ Technologies HR Analytics Report

Executive Summary & Core KPIs

1.1 Project Overview

This report evaluates workforce presence, remote work preferences, and sick leave trends at AtliQ Technologies for the period spanning **01-04-2022 to 30-06-2022**. By moving away from static files like "**Attendance-Sheet-2022-2023**" and implementing this interactive Power BI framework, HR management can dynamically isolate daily variations, optimize hybrid workplace utilization, and safeguard organizational productivity.

1.2 Executive KPI Summary

The top-level summary tiles on the dashboard establish key baseline benchmarks across a total of **1,525 Present Days** logged by the workforce during this timeframe:

- **Attendance (Presence) %: 94.0%** — This indicates a highly stable baseline of overall workforce availability across the evaluation period.
- **Work From Home (WFH) %: 9.1%** — Out of the active working days, approximately one-tenth are completed via remote channels, reflecting a measured utilization of hybrid work policies.
- **Sick Leave (SL) %: 0.4%** (Detailed inside tables as **0.43%**) — Represents a controlled, healthy baseline for unplanned medical absences across the organization.

Granular Performance Tables & Behavioural Analysis

2.1 Outlier Employee Tracking

The dashboard isolates specific behavioural variations at the individual level, allowing HR to address policy compliance or workload imbalances:

- **Low Attendance / High Remote Selection:** Employee Atq -485 registered an Attendance % of only **52.4%** across 11 present days, yet maintained a **100.0% WFH rate**, meaning they operated completely remotely whenever active.
- **Standard Hybrid Adaption:** Employees like Atq -398 and Atq -331 showcase stable hybrid structures, tracking attendance rates between **78.6% and 81.0%** alongside remote choices ranging between **9.1% and 11.8%**.

2.2 Day-of-Week Variation Breakdown

Aggregating data by working days reveals that employee behaviour changes systematically throughout the standard calendar week:

Day of the Week	Attendance (Presence) %	Work From Home (WFH) %	Sick Leave (SL) %
Monday	96.5% <i>(Highest Presence)</i>	7.0% <i>(Lowest WFH)</i>	0.16%
Tuesday	95.5%	7.8%	0.49%
Wednesday	94.2%	7.6%	0.32%
Thursday	90.3% <i>(Lowest Presence)</i>	10.3%	1.30% <i>(Highest SL)</i>
Friday	93.8%	12.2% <i>(Highest WFH)</i>	0.00% <i>(Lowest SL)</i>
Total Average	94.0%	9.1%	0.43%

Interactive Dashboard Visualization

Trend Insights & Strategic Recommendations

3.1 Timeline Trend Metrics & Spikes

Analysing the dashboard's chronological line charts over the tracked weeks exposes critical peaks and troughs that clash with standard averages:

- **Attendance Trajectory (% of Attendance over time):** While attendance remains mostly bound to a **92.1% – 97.4%** high-water corridor, a severe, sharp drop to **87.2%** occurs right before mid-month, pinpointing an event-based absence block.
- **Sick Leave Outbreaks (% of SL over time):** For the majority of the month, sick leave rests at a negligible 0.00% to 0.64%. However, a major single-day surge hitting **2.56%** is clearly visible, showing a clear, localized medical outbreak or tracking anomaly.
- **Shifting Remote Adaption (% of WFH over time):** Remote work follows an upward-sloping trendline. Starting at a low of **3.9% – 5.4%** early in the timeline, it experiences consecutive surges toward the end of the month, peaking heavily at **16.4%**

3.2 Strategic Business Recommendations

Based on the empirical evidence extracted the HR management team should execute the following operational actions:

- **Mitigate Friday Remote Strain:** Friday exhibits the highest remote choice (**12.2% WFH**). Atliq should avoid scheduling physical corporate client workshops or collaborative cross-functional meetings on Fridays, shifting them to Mondays when in-office presence peaks at **96.5%**.
- **Investigate Thursday Absenteeism:** Thursdays show a combined bottleneck holding the lowest overall presence (**90.3%**) and the highest concentration of sick leaves (**1.30%**). HR must audit Thursday operational workflows to check if mid week burnout or artificial logging patterns are skewing metrics.
- **Prepare for Scaled remote Infrastructure:** Because the *% of WFH over time* chart reveals an active upward trendline scaling from **3.9% up to 16.4%**, IT operations must ensure VPN bandwidth and remote security protocols are scaled to handle an expanding hybrid workload.
