

## HR ANALYTICS Business Problem Statement

A leading technology company, AtliQ Technologies, wants to better understand its workforce's presence patterns, hybrid work habits, and absenteeism in order to improve resource planning, employee wellness, and office infrastructure utilization. The HR management team has noticed fluctuating patterns across work preferences (Work from Home vs. Work from Office) and wants to closely track baseline metrics like presence percentages and sick leaves. They are particularly interested in uncovering which external factors, such as specific days of the week, seasonal changes, or major external events (festivals, flu seasons, or cricket matches), drive unexpected spikes in employee absence.

You are tasked with analysing the company's workforce dataset, specifically referencing **"Attendance-Sheet-2022-2023"**, to answer the following overarching business question:

**“How can the company leverage employee attendance and preference data to identify absenteeism trends, optimize hybrid work models, and ensure system migration readiness?”**

### Deliverables

1. **Data Extraction & Transformation (Power Query):** Connect directly to **"Attendance-Sheet-2022-2023"** inside Power BI. Clean and unpivot the raw monthly sheets into a normalized, lean tabular format. Standardize historical presence codes (such as full-day and half-day WFH) and replace null data to build a reliable data structure.
2. **Data Modelling & Calculations (DAX):** Establish a professional Star Schema inside Power BI by linking the flattened attendance facts to a dedicated Date Dimension table. Formulate robust DAX measures to calculate dynamic, baseline organizational metrics including **Presence %**, **WFH %**, and **Sick Leave %**.
3. **Visualization & Insights (Power BI Dashboard):** Build the interactive, executive-facing interface outlined in **"HR ANALYTICS"**. Design high-level KPI cards at the top for rapid summary scanning, integrate time slicers (day, week, month), and configure synchronized cross-filtering charts to enable direct "slice-and-dice" exploration.
4. **Project Report and Presentation:** Write a comprehensive project report summarizing key absenteeism habits, recurring weekly variations (such as Monday vs. Friday behaviours), and actionable business recommendations. Structure a presentation showing how the Power BI model can map directly to enterprise HR systems during future cloud application migrations.
5. **GitHub Portfolio Repository:** Package and upload the final interactive Power BI template file (.pbit or .pbix), dataset references, and the completed project documentation into a cleanly organized, public portfolio repository.
